

Tube Settler Media

BK-60-T Tube Settler Media utilize individual, isolated tubular channels, each sloped at 60° or 55° to expand their settling capacity of water and wastewater clarifiers. Engineered with the individual tubes rising in the same direction to eliminate mixing currents and unstable flow pattern. Constructed of flame-resistant, self-extinguishing PVC that is also inert to naturally occurring constituent in water and wastewater.

Improved Efficiency

The chevron shape and configuration of BK-60-T series module is engineered to create laminar flow for rapid settling of solids. This enhanced settling reduces chemical coagulant use and downstream filter backwash requirements. For plant design and upgrading less settling area is needed.
